sitright posture

Overview

SitRight is a wearable posture corrector designed for students and desk workers who spend long hours sitting. The device helps users become aware of poor posture habits by detecting slouching and gently alerting them after a few seconds. It focuses on subtle intervention rather than constant correction, encouraging users to build awareness over time without disrupting their workflow.

Concept

The device is designed as a compact, lightweight wearable that easily attaches to clothing, making it comfortable for long-term use. Instead of using loud or intrusive notifications, SitRight delivers discreet alerts that only the user can notice. The concept prioritizes minimalism and seamless integration into daily routines, ensuring the device supports behavior change without drawing attention or causing discomfort.

Problem Statement

How might we create a small, wearable device to make users notice and adjust for poor posture in real time without disruption?
